

Voltage level of photovoltaic power inverter

Overview

Inverters are used for DC to AC voltage conversion. Output voltage form of an inverter can be rectangle, trapezoid or sine shaped. Grid connected inverters have sine wave output voltage with low distortion ratio. Inverter input voltage usually depends on inverter power, for small power of. Input stage of a grid-tied inverter is usually buck or similar converter. With appropriate MPP algorithm conversion in at maximum power can be. The most important inverter parameters are rated DC and AC power, MPP Voltage range, maximum DC/AC current and voltage and rated DC/AC current and voltage. Other parameters are power in standby mode, power in sleeping (night) mode, power factor. Inverter efficiency is a ratio of AC power and DC power: [Equ 1] P_{DC} - DC array power, P_{AC} - output AC power Other efficiency definitions include conversion efficiency, MMPT. Islanding operation can be detected or monitored by passive or active islanding detection method. Passive method includes detecting rate of change of frequency, voltage.
